

(a) the constants are the curves:
 π for one, G^* for the other

(b) phase orbits: an ellipse keeps
 time, an oval counts its own size

(c) the clock lives on one surface:
 the threshold between one well and two

(d) degeneracy, seen: the valley
 opens along the clock direction

(e) dilation, seen: the moving clock's
 ticks are further apart in time

(f) and the behaviour that follows:
 one ignores amplitude, one counts it
