

(a) substrate: the light cone sits inside every candidate causal polytope

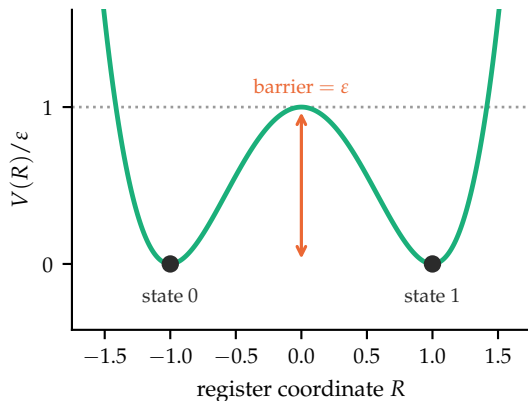

(b) clock: a bigger swing is a *faster* clock (ticks mark one period)

(c) the clock law, with no fitted scale: slope -1 and the constant is G^*

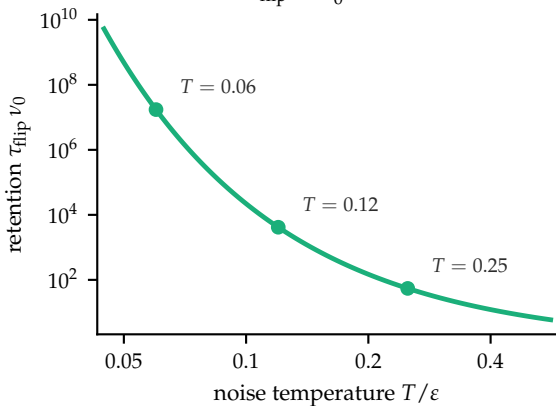

(d) register: two states, one barrier, and it is the same ϵ

(e) retention is Arrhenius:

$$\tau_{\text{flip}} \sim \nu_0^{-1} e^{\epsilon/T}$$

(f) gate: the weighting of actual events interpolates with the timescale ratio
