

(a) the causal cell at $t = 1$: 18 sites touched, every one outside the cone

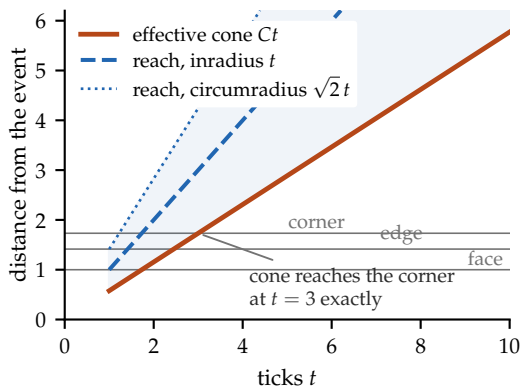

effective cone, radius C
octahedron: faces tangent
reach at $t = 1$: 18 sites

(b) four bookkeeping regions in (x, y, t) : cone inside reach, reach inside elsewhere

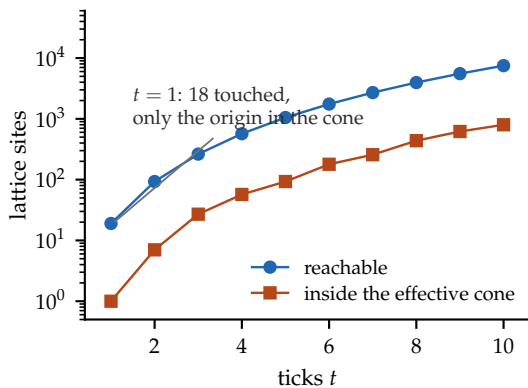

effective cone $C|t|$
reach $|t|$

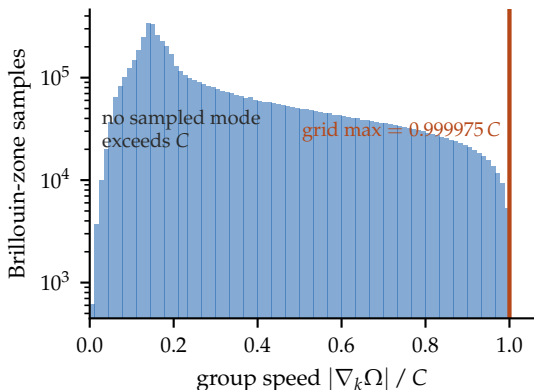

(c) the precursor shell is the gap between strict reach and the effective scale

(d) the cone acquires its first other site only at $t = 2$

(e) the grid scan finds none above C : C is the effective cone, not the front

(f) one Green-function profile: packet, then 10 decades of precursor, then nothing
