

(a) the causal cell at $t = 1$: 18 sites touched, every one outside the cone

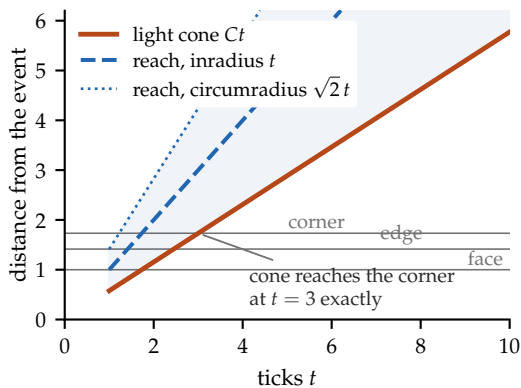

light cone, radius C
octahedron: faces tangent
reach at $t = 1$: 18 sites

(b) the four regions in (x, y, t) : cone inside reach, reach inside elsewhere

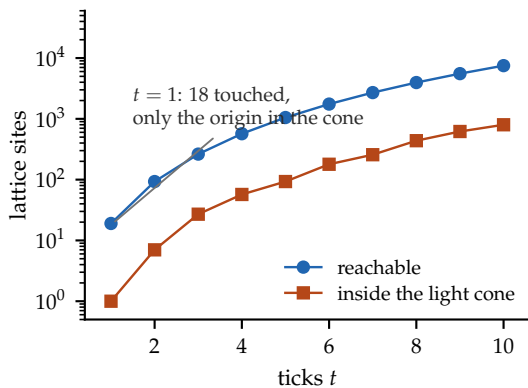

light cone $C|t|$
reach $|t|$

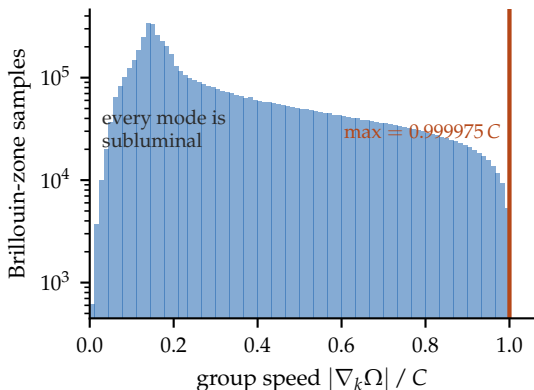

(c) the precursor shell is the gap between the two bounds

(d) the cone acquires its first other site only at $t = 2$

(e) no mode outruns C : the cone is a true signal front

(f) the Green's function: signal, then 10 decades of precursor, then nothing
